## Non-Surgical Vision Correction While You Sleep

---

Corneal Refractive Therapy, or CRT, is the safe high-tech way to improve your nearsighted vision. CRT is a non-surgical process that reshapes your cornea and corrects your vision as you sleep.

CRT is FDA approved for children and adults who qualify for the treatment. Vision correction improves within a few days and optimal vision is usually achieved within 1-2 weeks.

CRT is completely reversible. Stop wearing your lenses at night and within a few days your eyes will return to their previous refractive state.

### A Hybrid Contact Lens - Duettes

---

There is a new hybrid lens on the market known as the Duette lens. It has a rigid gas permeable center for crisp vision with a surrounding soft skirt for comfort. It is available as a multifocal lens or single vision HD (high definition) that can provide better monovision. Many have found this is a good alternative to their soft astigmatism lenses that move too much causing intermittent blur or their gas permeable lenses that do not provide adequate comfort.
